

Random Tensors, from quantum spaces to strongly interacting field theories

Prof. Dr. Razvan Gurau

Institut für Theoretische Physik, Universität Heidelberg

About 15 years ago, it was realized that Random Tensors exhibit a $1/N$ expansion dominated by melonic graphs. This result was the foundation of the theory of random tensors. In this talk, I will present this $1/N$ expansion and its implications for the study of random geometries and strongly interacting quantum field theories.
