

## **Emergent physics in atomically thin semiconductors**

Prof. Dr. Atac Imamoglu

*Institut für Quantenelektronik, ETH Zürich*

When two atomically thin semiconductor layers are stacked with a twist, interaction between electrons become dominant over their kinetic energy. Such a system provides a fertile ground for investigation of new physics, such as magnetism with kinetic origin or quantum Hall states in the absence of a magnetic field. In this talk, I will focus on our recent experiments on optical pumping of topological states.
